Art Unit: 1742

1. The Examiner has carefully considered Applicant's Response of 2/19/03. At this time, the Examiner has reconsidered the prior art to Benini, and finds that the the reference priority date of 4/22/98 pre-dates the disclosure to Applicant's invention to the high and low ductility metal combination which only finds support to the filing date of 10/06/00.

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1-10, 12, 16 and 18-32 are rejected under 35 U.S.C. 103(a) as being unpatentable over Benini.

Benini discloses the invention substantially as claimed. Benini discloses a projectile comprising an admixture of metal powders, wherein said admixture comprises: a first metal powder selected from a first group comprising Cu, Fe, Ni, Au, Ag, Pb, Cr and their alloys (col. 2, lines 63-65);

a second metal powder selected form a second group comprising Sn, Zn, Ga, Ge, Si, Ar, Al, In, An, Pb, Bi and their alloys (col. 3, lines 1-3).

Benini further discloses wherein his projectile is formed of unsintered metal particles in an intermetallic brittle metal binder (col. 4, lines 49-55).

Benini further discloses wherein the projectile may be fully dense or porous (col. 5, lines 43-50).

Benini further discloses examples with projectile density ranging from 6.53 g/cc to 7.27 g/cc (0.236 lb/in3 to 0.263 lb/in3) (col. 7, lines 31-38).

Benini further discloses an example wherein the powder size broadly overlaps that as claimed by Applicant (see Example 1), and leaves the general disclosure to one of ordinary skill in the art to select powder size based on the desired degree of frangibility. The Examiner finds that the selection of combinations from the small group of metals listed as first and second metal powders would result in densities within that claimed by Applicant.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Daniel J. Jenkins whose telephone number is 703-306-4157. The examiner can normally be reached on M-TH6:30AM-5:00PM.
